Novel cancer cell-specific HLA-F antigen useful for diagnosing cancer. Claim 2; Page 10-11; 12pp; Japanese.

This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the invention

cancer. The agent comprises a portion or a complete sequence of a human leukcoyte antigen (HLA)-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HLA-F DNA, or a plasmid or viral vector comprising HLA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HLA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HLA-F antigen and for diagnosing cancer. The present sequence represents part of the human cancer-cell specific HLA-F antigen.

The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

                                                                                                                                   11-OCT-2001.
                                                                                                                                                                                                                                                                                                                                                                                            Morin PJ,
```

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA831081-ABA83122, ABA83180, ABA8318181 and ABA831819). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for monitoring a patient in remission from ovarian cancer, in tests for monitoring disease status in a patient being treated for ovarian cancer.

Claim 23; Page 126-127; 140pp; English.

gene.

```
The methods can additionally be used to identify a particular tumour as being an ovarian tumour (i.e., an epithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, serous cystadenocarcinoma, mucinous cystadenocarcinoma, borderline serous tumour, mucinous cystadenocarcinoma, borderline serous tumour, mucinous cystadenocarcinoma, endometrioid carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, cystadenotibroma, and Brenner tumour. The ovarian tumour marker genes of the invention were identified using SAGE (serial analysis of gene expression) and were found to be using SAGE (serial analysis of gene expression) and were found to be relative to normal ovarian epithalial. The marker genes are implicated in immune response pathways, in the regulation of cell cralised or secreted. In addition to their use as diagnostic and progenism may be used as therapeutic targets for the treatment and prevention of ovarian cancer. Sequences ABBSO257-ABBSO299 represent proteins encoded by ovarian tumour marker genes of the invention

The present invention relates to an agent for preventing or treating cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HLA)-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HLA-F DNA, or a plasmid or viral vector comprising HLA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HLA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HLA-F antigen and for diagnosing cancer. The present sequence represents human cancer-cell specific antigen.
                                                                                                                                                                         Agent for preventing and treating cancer, comprising human leukocyte antigen-F DNA, or a plasmid or viral vector comprising the DNA.
                                                                                                                                                                                                                                                                                                                                            Claim 5; SEQ ID NO 4; 19pp; Japanese.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (51) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (52) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (5) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene, a ribozyme, a polymucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising a protein encoded by a marker gene; and (7) a DNA chip for testing for a protein activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present is used in the exemplification of the present invention.
                                                                                                                                                             disease by

                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammancory bowel diseases, multiple sclerosis, MIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cycostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                             Huntington's disease; osteoarthritis;
Leber's hereditary optic neuropathy; LHON;
mitochondrial encephalopathy lactic acidosis and stroke; MELAS;
myoclonic epilepsy ragged red fibre syndrome; MERRF; cancer;

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful it issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations diagnostics for generat types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic

                       AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB4338 to AAB4239. The proteins can have activities based on the tissues and calls the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiathmatic; antirheumatic; antidathritic; antidiabetic; antiathmatic; antirheumatic; antidiathritic] antinithyroid; antiphoratic; antibaterial; antiviral; dermarological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers cardiovascular disorders, neurological disease and panciates and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of

The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 12
```

```
The present invention relates to an agent for preventing or treating cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HiA-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HiA-F DNA, or a plasmid or viral vector comprising HiA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and a nati-HiA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HiA-F antigen and for diagnosing cancer. The present sequence represents part of the human cancer-cell specific HiA-F antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 RRYNQSBAGSHTLQGMNGCDMGPDGRLLRGYHQHAYDGKDYISLNEDLRSWTAADTVAQI 120

The present sequence is a polypeptide encoded by one of a large number of principle from RNMs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, game therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian

```
The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABP4131-ABP56305), and also encompasses polypeptides 90% identical and polymucleotides 93% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polymucleotides against human ovarian antigens and the use of ovarian antigens prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian encer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation.) polycystic ovary syndrome, ovarian craner and dysmenorine and toxic shock syndrome, ovarian prayet, and dysmenorine, and toxic shock syndrome, ovarian system, engonine disorders (e.g., chiamydia, HIV, toxoplasmosis, and toxic shock syndrome, ophorities, systemic lupus erythematosus), blood-related disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oobborities, systemic lupus erythematosus), blood-related disorders. Organizal and acquired immunodeficiencies, neurological disorders, gastrointestinal disorders and urinary system disorders. Ovarian antigen polypeptides and polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used for gene therapy, chromosome mapping, in the present squence represents a human ovarian antigen of the prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present squence represents a human ovarian antigen of the prepare antibodies squence attain, but was obtained in electronic format directly from WIPO at the will be present squence attained beta polymetered.
cancer), immune disorders, cardiovascular disorders and neurological

```
The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide as sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6808 amino acid sequences ("Illy defined in the specification." The probe is a single exon probe that where the stringency conditions to a nucleic acid molecule expression (comprising a plurality of single exon mucleic acid molecule expression (comprising a plurality of single exon mucleic acid addressably isolatable or manifitable from the plurality), a single continuous acids of manifitable from the plurality), a single measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above. mentioned amino acid exon probes contiguous amino acids of any of the above. mentioned amino acid sopposed applied comprising at least 8 contiguous amino acids of any of the above. mentioned amino acid soft any of the above any acid substitutions), an actorial and acid soft any of the above any probes or microarrays to a customer desiring to measure gene expression, and accomplete readable exon probe acception and adata by subscription, and accomplete readable exon probes may be used as tools for surveying to expression analysis. The probes may be used as tools for surveying content above. The probes may be used as tools for surveying to a pecific exon, or in constructing genome-derived single exon microarrays conting exon or in constructing genome-derived single exon probes protein of the probes are use
                                                                                                                                                                                               New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for

Sequence 799, Application US/10040862

Publication No. US20030078396A1

Sequence 799, Application US/10040862

Publication No. US20030078396A1

APPLICANT: Gaiger, Alexander

APPLICANT: Alexander

APPLICANT: Mannion, Jane

APPLICANT: Mannion, Jane

APPLICANT: Mannion, Jane

APPLICANT: Retter, Marc

APPLICANT: Retter, Marc

APPLICANT: Corixa Corporation

ITILE OF INVENTION: Compositions and Methods for the Detection, Diagnosis and Therapy

TILE OF INVENTION: Hemacological Malignancies

FILE REFERENCE: 014058-01352005

CURRENT FILING DATE: 2001-11-06

PRIOR APPLICATION NUMBER: US 60/180,479

PRIOR PILING DATE: 2000-03-17

PRIOR PAPLICATION NUMBER: US 60/200,303

PRIOR APPLICATION NUMBER: US 60/200,779

PRIOR PILING DATE: 2000-04-28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó

Sequence 115. Application US/08127954

Patent No. 5451512

GENERAL INFORMATION:
APPLICANT: Apple, Raymond J.
APPLICANT: Bugawan, Tecdorica L.
APPLICANT: Erlich, Henry A.
TITLE OF INVENTION: Methods and Reagents for HLA Class I A.
TITLE OF INVENTION: Locus DNA Typing
NUMBER OF SEQUENCES: 173
CORRESPONDENCE ADDRESS:
ADDRESSE: Hoffmann-La Roche Inc.
STREET: 340 Kingsland Street
CITY: Nutley
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 7.0%; Score 15; DB 1; Length 182; Best Local Similarity 100.0%; Pred. No. 3.9e-07; Matches 15; Conservative 0; Mismatches 0; Indels

This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the
                                                                                                                                                                                                                                                                                                                                                                                               Novel cancer cell-specific HLA-F antigen useful for diagnosing cancer.

cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HLA)-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HLA-F DNA, or protoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HLA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HLA-F antigen and for diagnosing cancer. The present

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB4239. The proteins can have activities based on the tissues and calls the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antidaterary; antibacterial; antidation; antidaterial; antithyroid; antidaterial; antibacterial; antibacterial; antibacterial; antibacterial; antibacterial; antidation; convergic; vasotropic; antipsoriatic and antianglogenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune cilential; and alergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and confidents and antagonists may be also be used in drug sorsens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

The present invention relates to an agent for preventing or treating cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HLA)-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HLA-F DNA, or a plasmid or viral vector comprising HLA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HLA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HLA-F antigen and for diagnosing cancer. The present sequence represents part of the human cancer-cell specific HLA-F antigen.
